

Alumi-Tek® Bottle Filler (ABF 1.0)

Description:

The Alumi-Tek® bottle filler is a two station, three stage bottle filler.

In the first stage, the filler purges oxygen from the bottle with CO₂. The second stage fills beer under a foam fob. The final stage is a top-off with foam/beer to achieve consistent fill levels.

The filler is PLC controlled for accurate filling. Each stage is individually controlled for ease of operation.

The system is able to achieve dissolved oxygen levels of 10-15 PPB. Fill rates of 6 bottles per minute are achievable with two proficient operators.
